The structure of the atom has been known to be of protons, electrons, and neutrons. The nature of the nuclei is the core of the atom and electrons are the bonding force to form the elements.

As the energy levels are composed of clouds of energy bound, but the core of the atom, which are the principles of the entities of time and space.

The Quantum Grid Theory, is the proposition that the antimatter of the atom is electrostatic energy and the force of gravity.

In the understanding is the coercive question of the form of particles, but rather entities, or fabrications of the forces of atomic structure.
